

## What is the **CLOUD**?

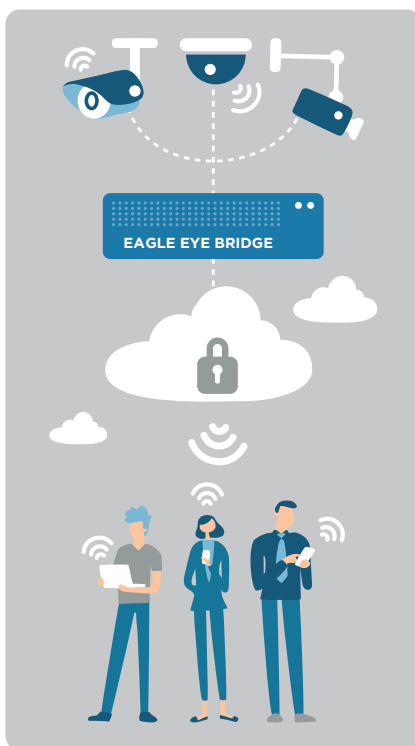

Essentially, the Cloud is the Internet. With Eagle Eye Networks, your video is stored in one of our 11 data centers worldwide, and it's accessed via an Internet connection. You're likely already using the Cloud in your everyday life. When you log into your email, your online banking, or your favorite television or music streaming service, you're using the Cloud.

### EXAMPLES OF CLOUD COMPANIES

**NETFLIX****amazon**

## Why should I store my video in the Cloud?

Remote storage is desirable for several reasons. In the Cloud, your video is safe from theft or equipment failure. It's also protected from physical threats like fire or other natural disasters. Eagle Eye Networks offers triple redundancy, meaning multiple copies of your video are stored in our servers, offering complete protection.

## What about **SECURITY**?

Your cybersecurity is protected every step of the way.

- No inbound Internet connections accepted
- Cameras are isolated from the Internet
- Appliances have no open network ports
- Appliances are protected against pre-installed camera malware
- Encryption applied to buffered and locally recorded video

## How much does it cost?

Companies can save money with cloud services.

With Eagle Eye Networks, there's no software to buy or servers to maintain. You don't need to hire IT personnel. The upfront investment is small, and you'll only pay for what you need with flexible camera subscriptions, which includes access to the application and free, automatic software updates.
