

CLOUD VIDEO SURVEILLANCE

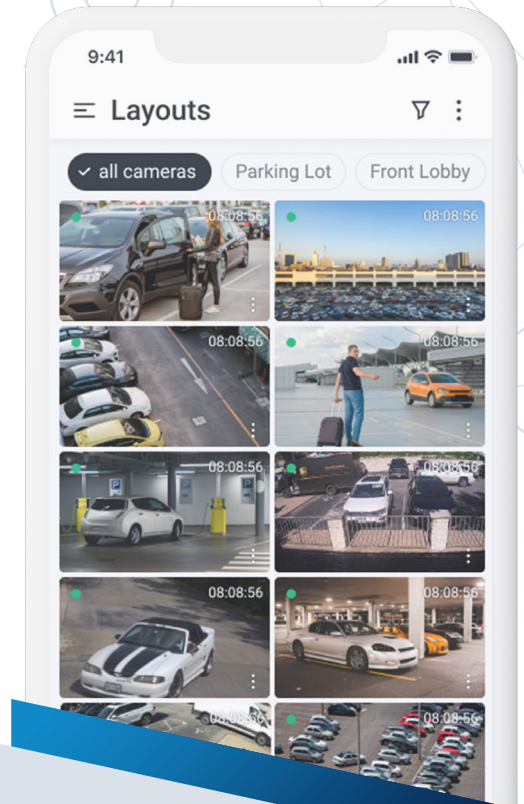

Car Rental Solution

AI-enhanced car rental security

Harness the power of Eagle Eye AI and license plate recognition (LPR) to track vehicles by license plate to see when and where those vehicles arrive to and depart from agency locations across the globe. Using a single system, access and investigate video-related events while using the cameras you have already installed. By adding a simple and low-cost appliance to each site, you can transform all your existing cameras into smart cameras that are centrally managed.

Why car rental agencies choose the Eagle Eye Cloud Video Management System

- Join all cameras and sites into a single, unified, and global system that can be managed centrally
- Refute customer claims of prior damage by validating vehicle condition upon entry and exit using vehicle tags across all locations
- Reduce internal theft by tracking vehicles being moved, cleaned, or fueled
- Monitor site perimeters automatically
- Detect anomalous afterhours site activity
- Utilize low-cost third party remote personnel to secure sites in higher crime areas and deter or prevent theft (catalytic converters and entire vehicles) and vandalism using speakers onsite to scare away criminals

The AI difference

- Apply License Plate Recognition AI to existing and standard security cameras
- Use AI to search video for human activity and the color of clothing people are wearing
- Reduce investigative time by automatically identifying vehicle make, model, and color using Smart Video Search
